

# cosmelan® depigmentation treatment

effective cosmetic depigmentation method

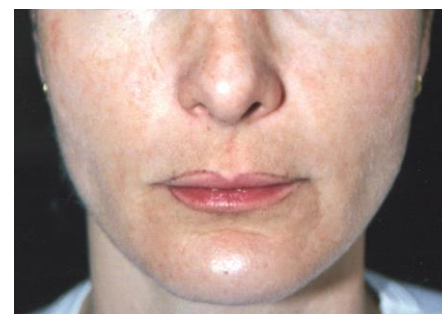

The **cosmelan** method acts within cells responsible for skin pigmentation, decreasing colour production in areas where excess production is apparent to achieve the disappearance or attenuation of unattractive blemishes caused by excess melanin in the skin.

This treatment has the following properties:

- Induces quick depigmentation action
- Highly effective for all kinds of skin blemishes (melisma, chloasma, senile blemishes, pregnancy blemishes, sunspots, blemishes due to oral contraceptives etc.)
- The **cosmelan** method can be initiated at any time of the year, provided the patient uses sun protection on a daily basis, so as to permit exposure to the sun without negative effects on the blemishes being treated.
- The cosmelan method is compatible with any skin phototype.

## RESULTS

During the first week the skin will already show substantial improvement. Blemishes being treated will tend to diminish and simultaneously, the skin will start to show a brighter rejuvenated look.
